

## R1155

The 1155 was the main receiver used in Bombers in WW11

Several different version covered from 75Khz – 18.5Mhz

They were used in the Lancaster, Halifax, Wellington Bomber

Half of the Radio was used for direction finding

The DF loop in the picture, sat on to of the roof in a pod

The loop was rotated to make the L and R needles line up

This was repeated on several coastal radio transmitters in England

By reading the degrees on the loop on each station

Your exact location could by found on a map (Bit like a SatNav)

The original small tuning dial was hopeless with gloves on

In the picture above a larger slow motion control was retro fitted

The R1155 also provide good range inter plane radio reception

The Receiver was well built and reliable

Vast numbers came on the second-hand market in the 1960's
